33 TUMOR TYPES

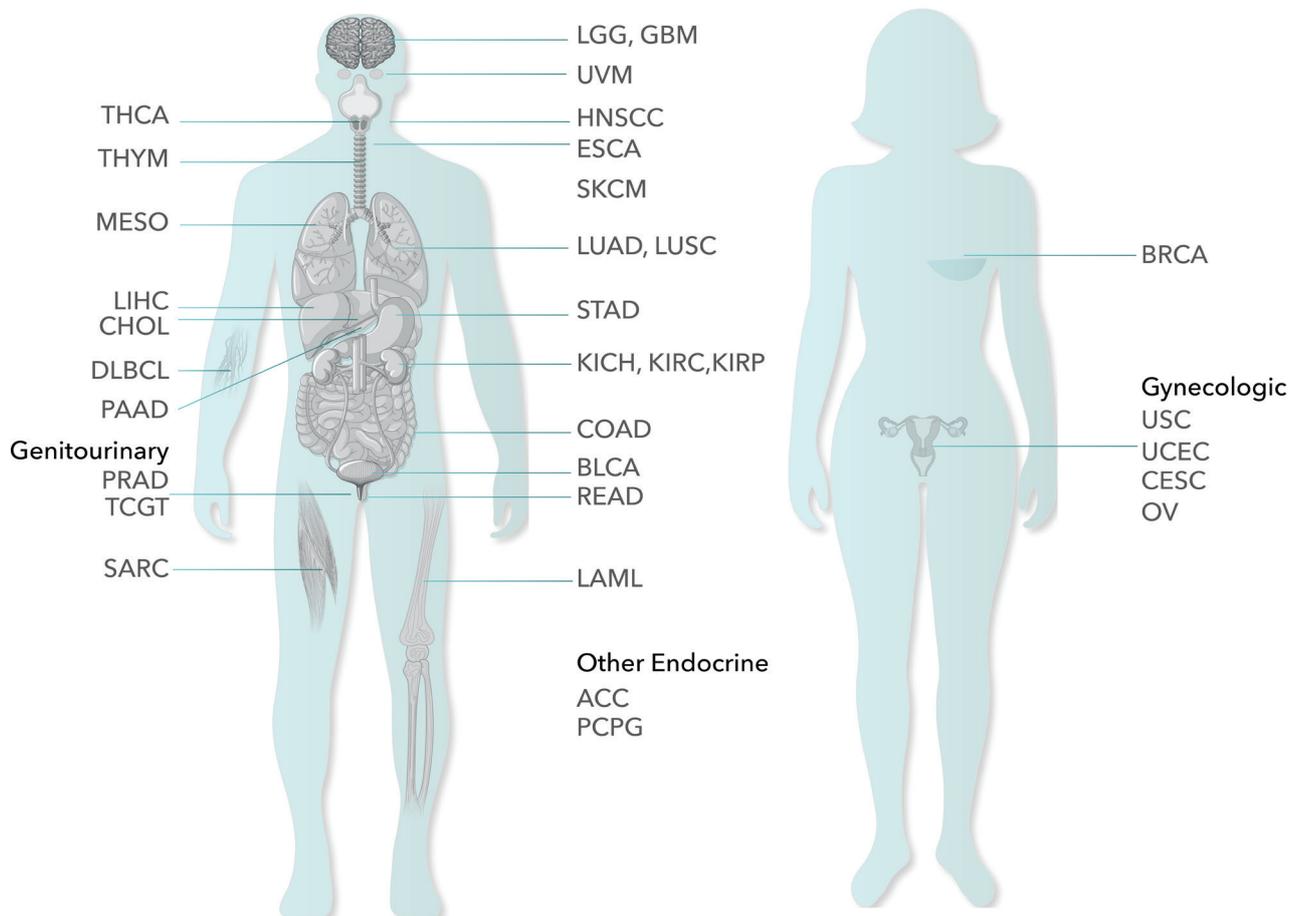

CODED ACCORDING TO THE PAN-CANCER ATLAS

185 PAN-CANCER CAMPAIGN GENES

CATEGORIZED BY TUMOR TYPE

309 PRIMARY ANTIBODIES

CLASSIFIED BY TUMOR TYPE

ATLAS ANTIBODIES

PAN-CANCER MARKERS FOR PROTEOMIC PHENOTYPING

Together with genomics and transcriptomics, proteomics plays a crucial role in understanding the complexity of cancer biology.

Atlas Antibodies is currently running an exclusive -15% sale campaign, providing limited-time discounts on over 300 Pan-Cancer antibodies which cover 33 tumor types featured in the Pan-Cancer Atlas.

The primary antibodies offered by Atlas Antibodies address critical areas such as biomarker detection, molecular profiling, and therapeutic target identification.

The antibodies are meticulously designed and validated for comprehensive coverage and enhanced validation, ensuring reliable results in various applications.

The antibodies have been validated on 20 human cancers and multiple cancer cell lines, making them a reliable tool for research projects (images available on humanproteome.com).

The antibodies are available as both polyclonal (Triple A Polyclonals™) and monoclonal (PrecisA Monoclonals™).

The offer is valid until August 31st providing you with an excellent opportunity to enhance your proteomic phenotyping studies at a reduced cost.

ATLAS ANTIBODIES

Atlas Antibodies Advanced Polyclonals.

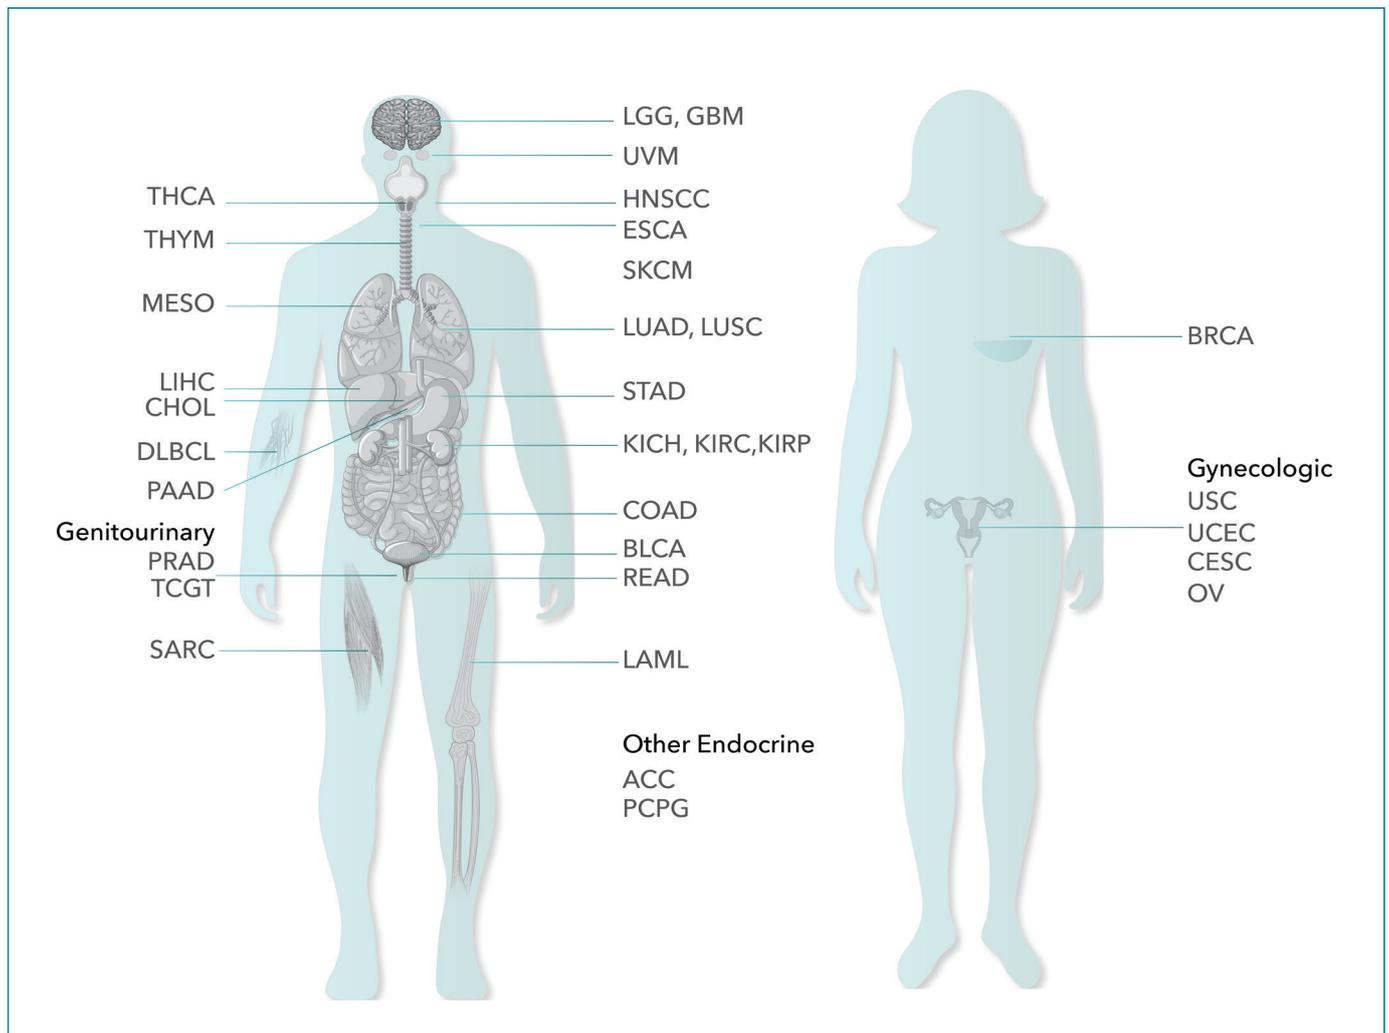

Triple A Polyclonals™ are rabbit polyclonals developed within the Human Protein Atlas project. IHC characterization data from 44 normal and 20 cancer tissues is available on the Human Protein Atlas portal.

Precise. Accurate. Targeted.

PrecisA Monoclonals™ are mouse monoclonals developed against a number of carefully selected targets. Clones are selected to recognize only unique non-overlapping epitopes and isotypes.

33 TUMOR TYPES CODED ACCORDING TO THE PAN-CANCER ATLAS

The "Pan-Cancer Atlas" is a comprehensive research effort initiated by The Cancer Genome Atlas (TCGA) consortium. It aims to analyze molecular data from thousands of cancer samples across various cancer types employing multi-omic analysis to uncover commonalities and differences in cancer biology. The project classifies cancers into 33 primary tumor and disease types based on their tissue of origin, disease diagnosis, and molecular characteristics. These tumor types are coded according to a standardized classification system developed by the TCGA consortium. See Table 1 for criteria description.
